# CE95327 – PSoC<sup>®</sup> 4 Current Digital-to-Analog Converter

# **Objective**

This code example demonstrates the use of the current digital-to-analog converter (IDAC).

#### Overview

This code example shows the capability of the Current Digital-to-Analog Converter (IDAC) to change its current output with firmware. The current increases when a switch is pressed. Once the output reaches its maximum value, it resets to zero and starts to increase the value again. If switch is not pressed, the last value is maintained.

## Requirements

Tool: PSoC Creator™ 4.2 or higher

Programming Language: C (ARM® GCC 5.4)

Associated Parts: PSoC® 4

Hardware: CY8CKIT-042, CY8CKIT-042-BLE, CY8CKIT-044, CY8CKIT-046

### Design

The example demonstrates one way of using the IDAC Component. It is configured as an 8-bit IDAC with a range of 0–612  $\mu$ A (2.4  $\mu$ A/count). Firmware detects when the switch (SW2) is pressed and slowly increases the IDAC output with the IDAC8 SetValue() function, until the switch is released. See Figure 1 below for schematic.

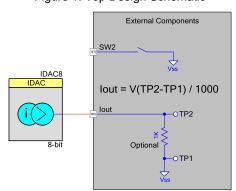

Figure 1. Top Design Schematic

# Kit Configuration and Pin Assignments

1. Select the appropriate device for the kit you are using according to Table 1. By default the project is configured for the CY8CKIT-042. To select the correct device, click on the "Project" menu and select the "Device Selector" sub-menu.

Development Kit	Device
CY8CKIT-042	CY8C4245AXI-483
CY8CKIT-042-BLE	CY8C4247LQI-BL483
CY8CKIT-044	CY8C4247AZI-M485
CY8CKIT-046	CY8C4248BZI-L489

Table 1. Development Kits and Associated Devices

You can change the pins used by selecting the "Pins" tab in the "Design Wide Resources" view to match Table 2. As
mentioned above, the project is initially configured for the CY8CKIT-042 kit, so all references to GPIO pins used will be for
the CY8CKIT-042 kit.

Table 2. Pin Assignments

	Development Kit			
Pin Name	CY8CKIT- 042	CY8CKIT- 042-BLE	CY8CKIT- 044	CY8CKIT- 046
lout	P0[0]	P0[0]	P0[0]	P1[2]
SW2	P0[7]	P2[7]	P0[7]	P0[7]

# Components

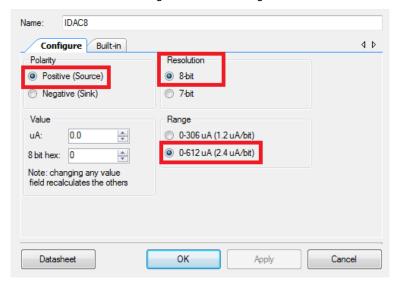

Table 3 lists the PSoC Creator Components used in this example (CY8CKIT-042), as well as the hardware resources used by each.

Table 3. PSoC Creator Components

Component	Usage	Hardware Resources	
IDAC	Current DAC	CSIDAC0/1	
Pin	IDAC output	GPI0 (pin P0[0])	
Pin	SW2 Input	GPIO (pin P0[7])	

The IDAC is configured for positive polarity (source), 8-bit resolution and the 612 uA range, as shown in Figure 2. Initial value doesn't matter since it will be over written by the firmware to 0 uA.

Figure 2. IDAC Configuration

# **Operation**

This example project requires a multi-meter to measure the output current. Follow these steps below to exercise the project.

- 1. Make sure that the kit has been configured as instructed in the Kit Configuration and Pin Assignments section.
- 2. Connect the USB cable between the PC and the kit.
- 3. Build the project and program the PSoC 4 device.

- 4. Measure the current between pin lout (P0[0]) and Vss. This can be done in two ways:
  - a. Use a sensitive amp meter that can resolve down to a couple uAmps and connect it across pin lout (P0[0]) and Vss. (Remove the 1K resistor shown in the schematic.)
  - b. Leave the 1K resistor in the circuit as shown and use a voltmeter to measure the voltage across the resistor. The conversion between amps and volts is just ohms law, I = V/R. With a 1K shunt resistor, the voltage output will be between 0 and 612mV instead of 0 to 612uA.
- 5. Press and hold the switch (SW2) to observe the current (or voltage) increase until it exceeds 612uA (or 612mV) then starts back at 0.
